Points to note

Physical cleaning method: As the name suggests, it is a relatively basic dust removal method. It uses an air pump, special cotton swabs, high-grade lens paper, and imported precision instrument cleaning agents to remove dust and clean the inside and outside of the machine step by step. This will not damage the internal molecular structure of the lens. However, you should also pay attention to the wiping technique and intensity. Once the lens positioning is accidentally damaged, image misalignment and other difficult adjustment problems will occur.
